

A Fitting time: R spicyGLM() vs spicyglm (synthetic data, 5,000 cells per image)

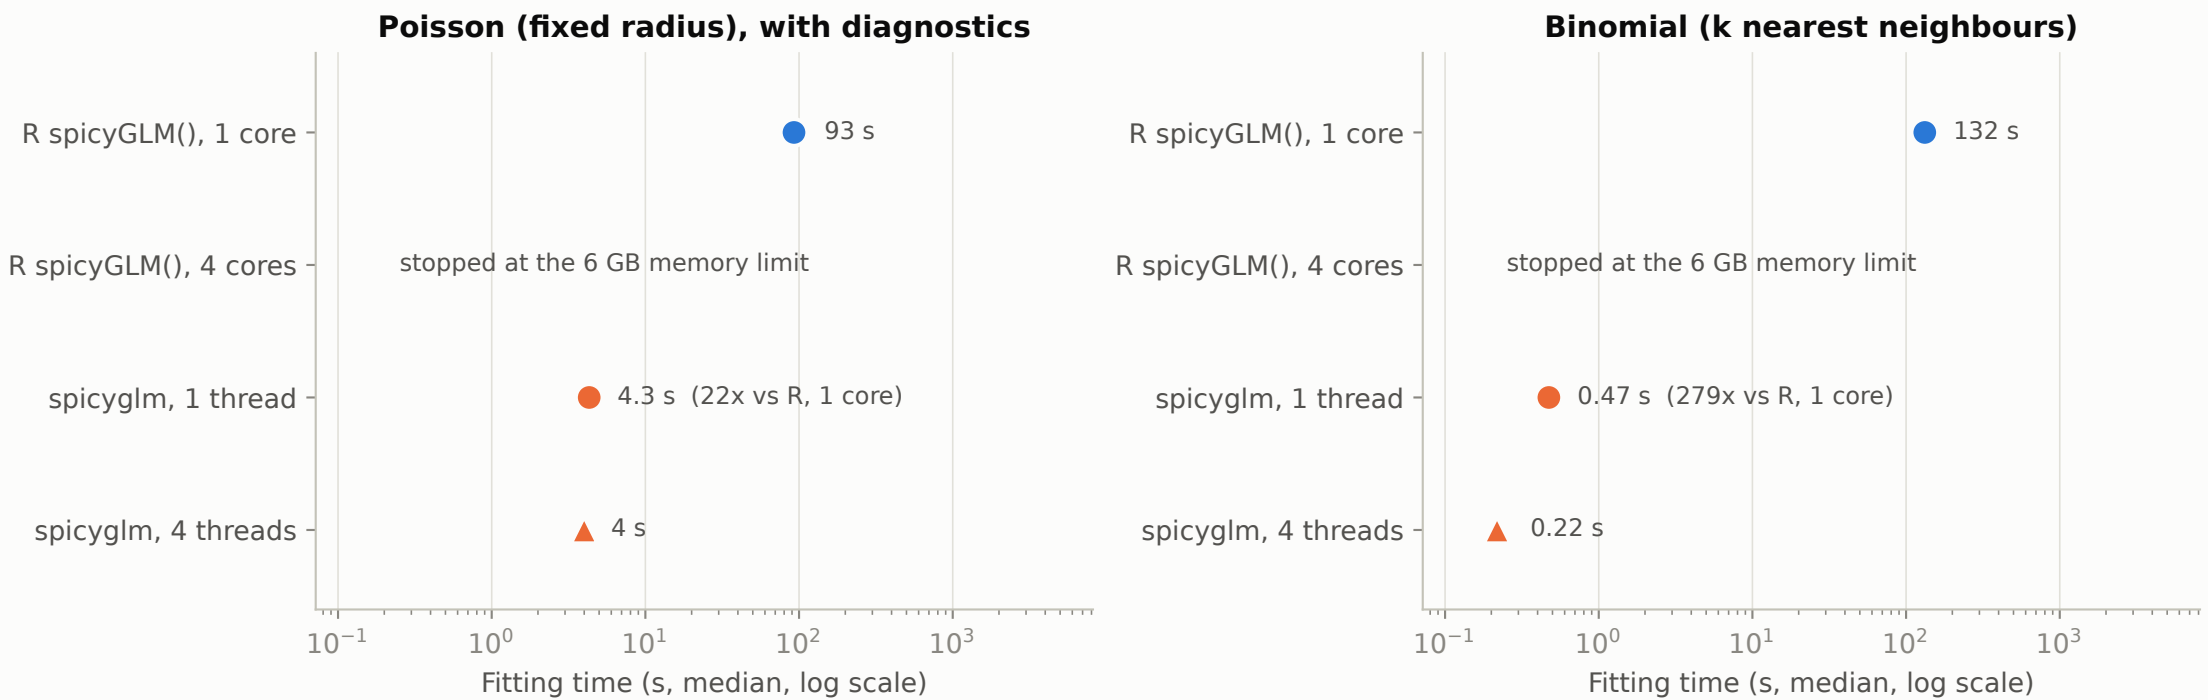

B Speed-up of spicyglm over R spicyGLM(), same number of workers

C Peak memory: whole process tree, including start-up and reading the CSV

D Schürch 2020 colorectal cancer CODEX data (258,385 cells, 140 images, 435 pairs)

Medians over repeated runs (5 spicyglm, 3 R); whiskers show the fastest and slowest run. Fitting time only, one laptop (Apple silicon, 10 cores, 24 GB). R spicyGLM() with 4 cores was stopped at the 6 GB memory limit above 250k cells and on Schürch 2020 (memory summed over its forked workers).
